

30V, 3A Synchronous Step-Down DC/DC Converter with Adjustable Switching Frequency

FEATURES

- High Efficiency: Up to 95%@12V to 5V
- Wide input voltage: 4.5V ~ 30V
- Up to 3A Output Current
- Low Typical 3 μ A Shutdown Current
- Internal Fixed 1.4ms Soft-Start
- 50kHz to 1.5MHz Adjustable Frequency
- Stable with Low ESR Ceramic Output
- Peak Current Mode with External Compensation
- PFM in Light Load Condition
- 0.8V Voltage Reference with $\pm 2\%$ Accuracy
- Thermal Shutdown
- Cycle-by-cycle Current Limit Protection
- Over Current Protection with Hiccup Mode
- ESOP8 Package

GENERAL DESCRIPTION

TMI3343B is a wide input voltage of 4.5V to 30V, high efficiency current mode, synchronous step-down DC/DC converter capable of delivering 3A current with adjustable switching frequency from 50kHz to 1.5MHz. TMI3343B integrates main switch and synchronous switch with low $R_{DS(on)}$ to minimize the conduction loss.

The device integrates 120m Ω High-Side and 80m Ω Low-side Power MOS, and has advanced features include UVLO, Thermal Shutdown, Soft Start, input OVP.

APPLICATIONS

- Smart Home Applications
- Vacuum Robot
- Printer
- Consumer Applications: TV and Set Top Box
- General 5V, 12V, 24V DC/DC Power Bus Supply

TYPICAL APPLICATION

Figure 1. Basic Application Circuit

Efficiency

$V_{OUT}=5V$, $I_{OUT}=0.01A$ to $3.3A$, $T_A=25^\circ C$

ABSOLUTE MAXIMUM RATINGS (Note 1)

Parameter	Value	Unit
Input Supply Voltage, SW	-0.3~33	V
BS to SW Voltage	-0.3~6.0	V
All Other Pins (FB, EN, RT, COMP) Voltage	-0.3~6.0	V
Storage Temperature Range	-50~150	°C
Junction Temperature (Note2)	-40~150	°C

PACKAGE/ORDER INFORMATION

Top Mark: T3343B/YYXXX (T3343B: Device Code, YYXXX: Inside Code)

Part Number	Package	Top mark	Quantity/ Reel
TMI3343B	ESOP8	T3343B YYXXX	3000

TMI3343B devices are Pb-free and RoHS compliant.

PIN FUNCTIONS

Pin	Name	Function
1	BS	High-side Gate Driver Bootstrap pin, Provide supply to high-side LDMOS Gate Driver. Connect a 100nF capacitor between BS and SW
2	IN	Power Input pin
3	SW	Switch Pin, Connect to external Inductor
4	GND	Ground Pin
5	FB	Feedback Pin
6	COMP	External Compensation Pin
7	EN	Enable Pin. Drive EN above 1.5V to turn on the device. Drive EN below 0.4V to turn it off. Do not leave EN floating.
8	RT	Connect the RT pin to an external resistor to adjust the switching frequency of the device.
9	GND	Ground (Exposed pad)

ESD RATING

Items	Description	Value	Unit
V _{ESD}	Human Body Model for all pins	±2000	V

JEDEC specification JS-001

RECOMMENDED OPERATING CONDITIONS

Items	Description	Min	Max	Unit
Voltage Range	V _{IN}	4.5	30	V

THERMAL RESISTANCE

Items	Description	Value	Unit
θ _{JA}	Junction-to-ambient thermal resistance	60	°C/W

ELECTRICAL CHARACTERISTICS (Note 3)

($V_{IN}=12V$, $V_{OUT}=5V$, $T_A = 25^{\circ}C$, unless otherwise noted.)

Parameter	Symbol	Conditions	Min	Typ	Max	Unit
Input Voltage Range	V_{IN}		4.5		30	V
Under Voltage Lockout	V_{UVLO}	V_{IN} rising		4.3		V
UVLO Hysteresis	V_{UVLO_HY}			0.35		V
Input OVP Voltage	V_{INOVP}			32		V
Input Quiescent Current	I_Q	$V_{FB}=1V$		0.38	0.48	mA
Input Supply Current	I_{IN}	No load		0.45		mA
Shutdown Current	I_{SD}	EN = 0V		3	10	μA
Feedback Threshold Voltage	V_{FBTH}	PWM operation	784	800	816	mV
FB Pin input current	I_{FB}		-50		50	nA
EN High Level Input Voltage	V_{EN_High}		1.5			V
EN Low Level Input Voltage	V_{EN_Low}				0.4	V
EN sink current	I_{EN_Sink}				1	mA
Soft start time	T_{SS}			1.4		ms
High-side cycle-by-cycle current limit	I_{LIM_MAX}			4.2		A
SW leakage	I_{SW_LEAK}				10	μA
Switch On-Resistance (high side)	$R_{DS(on)_H}$			120		m Ω
Switch On-Resistance (low side)	$R_{DS(on)_L}$			80		m Ω
Switching Frequency	F_{SW}	$R_T=50k\Omega$		1050		kHz
		$R_T=150k\Omega$		345		kHz
		$R_T=500k\Omega$		105		kHz
Minimum Turn-on Time (Note 3)	T_{ON_MIN}			200		ns
FB UV Threshold to Hiccup (Note 3)	V_{UV}	V_{FB} refers to V_{REF}		35%		
Hiccup on Time (Note 3)				2		ms
Hiccup Time Before Restart (Note 3)				64		ms
Maximum Duty-cycle	D_{MAX}			91		%
Thermal Shutdown Threshold (Note 3)	T_{SDN}			160		$^{\circ}C$
Thermal Shutdown Hysteresis (Note 3)	T_{SDN_HY}			10		$^{\circ}C$

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: T_J is calculated from the ambient temperature T_A and power dissipation P_D according to the following formula: $T_J = T_A + (P_D) \times \theta_{JA}$.

Note 3: Guaranteed by design.

FUNCTIONAL BLOCK DIAGRAM

Figure 2. TMI3343B Block Diagram

FUNCTION DESCRIPTION

Overview

As seen in Functional Block Diagram, the TMI3343B is a peak current mode pulse width modulation (PWM) converter. The converter operates as follows:

A switching cycle starts when the rising edge of the oscillator clock output causes the High-Side Power Switch to turn on and the Low-Side Power Switch to turn off. With the SW side of the inductor now connected to IN, the inductor current ramps up to store energy in the magnetic field. The inductor current level is measured by the Current Sense Amplifier and added to the Oscillator ramp signal. If the resulting summation is higher than the COMP voltage, the output of the PWM Comparator goes high. When this happens or when Oscillator clock output goes low, the High-Side Power Switch turns off.

At this point, the SW side of the inductor swings to a diode voltage below ground, causing the inductor current to decrease and magnetic energy to be transferred to output. This state continues until the cycle starts again. The High-Side Power Switch is driven by logic using BS as the positive rail. This pin is charged to $V_{SW} + 5V$ when the Low-Side Power Switch turns on. The COMP voltage is the integration of the error between FB input and the internal 0.8V reference. If V_{FB} is lower than the reference voltage, COMP tends to go higher to increase inductor current to the output side and try to increase output voltage.

In light or no load condition, TMI3343B is operating in PFM mode for power saving. In PFM mode, the device ramps up its output voltage with one or several SW switching pulse, while the error amplifier output voltage V_{COMP} drops. The device stops switching when V_{COMP} voltage drops down the inner threshold, then the output voltage falls down and V_{COMP} voltage rises until V_{COMP} voltage is high enough to generate SW switching pulse.

Input Over Voltage Protection

The thresholds of input OVP circuit include are typical 32V. Once the input voltage is higher than the threshold, the high-side MOSFET is turned off. When the input voltage drops lower than the threshold with hysteresis, the high-side MOSFET will be enabled again. This function protects device from switching in abnormal high input voltage and input surge condition.

Over-Current-Protection and Short Circuits Protection

The TMI3343B has cycle-by-cycle peak current limit function. The periodic current limit of the high side MOSFET can protect this device in case of overload, and prevent the current from losing control through valley current limit. Low side charge current limiting can shut down low side MOSFET to prevent excessive reverse current.

If the output is short to GND and the output voltage drop until feedback voltage V_{FB} is below the output under-voltage V_{UV} threshold which is typically 35% of V_{REF} , TMI3343B enters into hiccup mode to periodically disable and restart switching operation. The hiccup mode helps to reduce power dissipation and thermal rise during output short condition. The period of TMI3343B hiccup mode is typically 66ms.

Input Under Voltage Lockout

TMI3343B implements input under voltage lockout function to avoid mis-operation at low input voltages. When the input voltage is lower than input UVLO threshold with UVLO hysteresis, the device is shut down. The typical 350mV input UVLO hysteresis value of TMI3343B is useful to prevent device from abnormal switching caused by input voltage oscillation around UVLO threshold during input voltage power-up and power-down with high load condition.

Soft Start

TMI3343B has built-in soft-start circuits to control output voltage rise rate to avoids excessive inrush current during IC start up. The typical soft-start time is 1.4ms typically.

Enable and Disable

TMI3343B EN pin has a 5V Zener diode to clamp EN pin voltage. Drive EN above 1.5V to turn on the device. Drive EN below 0.4V to turn it off. If there is no EN logic control signal implemented on EN pin, EN could be pulled up to input voltage by a resistor. Please note the pull-up resistance value and make sure EN sink current is smaller than 1mA. EN pin cannot be floating.

Thermal Shutdown

The TMI3343B disables switching when its junction temperature exceeds 160°C typically, Once the device junction temperature falls below the threshold with hysteresis, TMI3343B returns to normal operation automatically.

APPLICATION INFORMATION

Output Voltage Setting

Figure 3. Output Voltage Setting

Figure 3 shows the connections for setting the output voltage. Select the proper ratio of the two feedback resistors R1 and R2 based on the output voltage. Adding a capacitor in parallel with R1 helps the system stability. Typically, use $R2 \approx 10k\Omega$ and determine R1 from the following equation:

$$R1 = R2 \cdot \left(\frac{V_{OUT}}{V_{REF}} - 1 \right)$$

Switching Frequency Setting

TMI3343B switching frequency value is set by a resistor connected between the RT pin and GND. To determine the RT pin resistance R_T , for a given switching frequency, use following equation:

$$R_T(k\Omega) = 56390 \times f_{SW}^{-1.014}(kHz)$$

Figure 4 gives the curve of switching frequency vs. RT resistance. To reduce the solution size, set the switching frequency as high as possible, but consider the tradeoffs of the supply efficiency and minimum controllable on time.

Figure 4. RT Set Resistor vs Switching Frequency

Inductor Selection

Inductance value is related to inductor ripple current value, input voltage, output voltage setting and switching frequency. The inductor value can be derived from the following equation:

$$L = \frac{V_{OUT} \times (V_{IN} - V_{OUT})}{V_{IN} \times \Delta I_L \times f_{SW}}$$

Where ΔI_L is inductor ripple current. Large value inductors result in lower ripple current and small value inductors result in high ripple current, so inductor value has effect on output voltage ripple value, however large value inductor have large size and is more expensive. DC resistance of inductor which has impact on efficiency of DC/DC converter should be taken into account when selecting the inductor.

The saturation current rating of the inductor should be considered. The saturation current must be larger than peak inductor current with maximum load conditions in all operation conditions, for example, maximum load transient condition. The peak inductor current value can be calculated according to the following equation. Meanwhile, if the system has output short condition, the saturation current of inductor should cover peak current limit value of the device.

$$I_{L_peak} = I_{OUT_MAX} + \frac{1}{2} \times \Delta I_L = I_{OUT_MAX} + \frac{V_{OUT} \times (V_{IN_MAX} - V_{OUT})}{2 \times V_{IN_MAX} \times L \times f_{SW}}$$

Input Capacitor Selection

Since the input current of the Buck converter is discontinuous, the input capacitor is needed to supply the AC current while maintaining the DC input voltage. The input capacitor impedance at the switching frequency should be less than input source impedance to prevent high frequency switching current passing to the input. A low ESR input capacitor sized for maximum RMS current must be used. Ceramic capacitors with X5R or X7R dielectrics are highly recommended because of their low ESR and small temperature coefficients. The voltage rating should be greater than the maximum input voltage plus input voltage ripple. A 10 μ F effective capacitance value ceramic capacitor for most applications is sufficient. A large value may be used for improved input voltage filtering. Additionally, a small 0.1 μ F ceramic capacitor located close on input pin and GND pad is help for high frequency filter.

Output Capacitor Selection

The output capacitor is required to keep the output voltage ripple small in steady status and load transient condition, and to ensure regulation loop stability. The output ripple ΔV_{OUT} is determined by:

$$\Delta V_{OUT} \approx \Delta I_L \times \left(ESR + \frac{1}{8 \times f_{SW} \times C_{OUT}} \right) = \frac{V_{OUT} \times (V_{IN} - V_{OUT})}{2 \times V_{IN} \times L \times f_{SW}} \times \left(R_{ESR} + \frac{1}{8 \times f_{SW} \times C_{OUT}} \right)$$

Where R_{ESR} is the equivalent series resistance value of output capacitor. As shown in above equation, the smaller ESR value and larger capacitance value of output capacitors, the smaller output voltage ripple. If ceramic capacitors are used as output capacitors, the output ripple is mainly depended on output capacitance value since the ceramic capacitors have low ESR value. If tantalum or electrolytic capacitors are used as output capacitors, R_{ESR} dominates the output ripple value since the electrolytic capacitors have significantly higher ESR value. The TMI3343B can be optimized for a wide range of output capacitance and ESR values.

PC Board Layout Guidance

When laying out the printed circuit board, the following checklist should be used to ensure proper operation of the IC.

- 1) Arrange the power components to reduce the AC loop size consisting of C_{IN} , IN pin and SW pin.
- 2) Place input decoupling ceramic capacitor C_{IN} as close to IN pin as possible. C_{IN} is connected power GND with vias or short and wide path.
- 3) Return FB, COMP and RT to signal GND pin, and connect the signal GND to power GND at a single point for best noise immunity. Connect exposed pad to power ground copper area with copper and vias.
- 4) Use copper plane for power GND for best heat dissipation and noise immunity.
- 5) Place feedback resistor close to FB pin.
- 6) Use short trace connecting BS- C_{BS} -SW loop

TYPICAL PERFORMANCE CHARACTERISTICS

($V_{IN}=12V$, $V_{OUT}=5V$, $C_{IN}=22\mu F$, $C_{OUT}=22\mu F \times 4$, $L1=12\mu H$, $T_A=25^\circ C$, unless otherwise noted.)

Efficiency

$V_{OUT}=5V$, $T_A=25^\circ C$

Load Regulation

$V_{OUT}=5V$, $T_A=25^\circ C$

Steady State

$V_{in}=12V$, $V_{OUT}=5V$, $I_{OUT}=0A$, $T_A=25^\circ C$

Steady State

$V_{in}=12V$, $V_{OUT}=5V$, $I_{OUT}=3A$, $T_A=25^\circ C$

Output Short Entry

$V_{IN}=12V$, $V_{OUT}=5V$, No load

Output Short Recovery

$V_{IN}=12V$, $V_{OUT}=5V$, No Load

TYPICAL PERFORMANCE CHARACTERISTICS (Continued)

VIN Power On

$V_{IN}=12V$, $V_{OUT}=5V$, $I_O=3A$

VIN Power Off

$V_{IN}=12V$, $V_{OUT}=5V$, $I_O=3A$

Power On through EN

$V_{IN}=12V$, $V_{OUT}=5V$, $R_O=1.6\Omega$

Power Off through EN

$V_{IN}=12V$, $V_{OUT}=5V$, $R_O=1.6\Omega$

Load Transient

$V_{IN}=12V$, $V_{OUT}=5V$, $I_{OUT}=0A$ to $3A$

Load Transient

$V_{IN}=12V$, $V_{OUT}=5V$, $I_{OUT}=1.5A$ to $3A$
