
2x40W Stereo / 1x 80W Mono / 2x20W+1x40W 2.1CH
Digital Audio Amplifier with 20 Bands EQ

Features

- 16/18/20/24-bits input with I²S, Left-alignment and Right-alignment data format
- PSNR & DR (A-weighting)
Stereo: 98dB (PSNR), 107dB (DR) @24V
- Multiple sampling frequencies (Fs)
32kHz / 44.1kHz / 48kHz and
64kHz / 88.2kHz / 96kHz and
128kHz / 176.4kHz / 192kHz
- System clock = 64x, 128x, 192x, 256x, 384x, 512x, 576x, 768x, 1024x Fs
64x~1024x Fs for 32kHz / 44.1kHz / 48kHz
64x~512x Fs for 64kHz / 88.2kHz / 96kHz
64x~256x Fs for 128kHz / 176.4kHz / 192kHz
- BCLK system supports
- Supply voltage
3.3V for digital circuit
7V~26V for loudspeaker driver
- Loudspeaker output power for stereo at 24V
40W x 2CH into 4Ω @0.22% THD+N
- Loudspeaker output power for mono at 24V
80W x 1CH into 4Ω @10% THD+N
- Loudspeaker output power for 2.1CH at 24V
20W x 2CH into 8Ω @0.25% THD+N
40W x 1CH into 4Ω @0.22% THD+N
- Sound processing including :
20 bands parametric speaker EQ
Volume control (+24dB~-103dB, 0.125dB/step),
Dynamic range control
Dual Band Dynamic range control
Power Clipping
3D surround sound
Channel mixing
Noise gate with hysteresis window
Bass/Treble tone control
Bass management crossover filter
DC-blocking high-pass filter
- Power on reset
- Anti-pop design
- I²C control interface (without MCLK) with selectable device address
- Support hardware and software reset

- Internal PLL
- LV Under-voltage shutdown and HV Under-voltage detection
- Short-circuit and over-temperature protection
- Power saving mode
- Tunable surround sounds
- Support initial EEPROM setting

Applications

- CD and DVD
- TV audio
- Car audio
- Boom-box
- MP3 docking systems
- Powered speaker
- Wireless audio

Description

AD83586B is a digital audio amplifier capable of driving a pair of 8Ω, 20W plus a single 4Ω, 40W, or a pair of 4Ω, 40W or a single 4Ω, 60W speaker operating at 24V supply with proper cooling method.

AD83586B can provide advanced audio processing capabilities, such as volume control, 20 bands speaker EQ, audio mixing, 3D surround and Dynamic Range Control (DRC). These functions are fully programmable via a simple I²C control interface. Robust protection circuits are provided to protect AD83586B from damage due to accidental erroneous operating condition. AD83586B is more tolerant to noise and PVT (Process, Voltage, and Temperature) variation than the analog Class-AB or Class-D audio amplifier counterpart implemented by analog circuit design. AD83586B is pop free during instantaneous power switch because of its built-in, robust anti-pop circuit.

The output stage is flexibly configurable for 2.1 channel, stereo or mono applications. Furthermore, it is possible to use three pieces of AD83586B to realize 5.1 channels for home theater applications.

Pin Assignment

Pin Description

PIN	NAME	TYPE	DESCRIPTION	CHARACTERISTICS
1	SDATA1	I	Serial audio data input 1	Schmitt trigger TTL input buffer
2	MS	I	EEPROM selection	Schmitt trigger TTL input buffer
3	PLL	I	PLL enable, low active	Schmitt trigger TTL input buffer
4	CFG0	I	2.1 Ch/Stereo/Mono configuration pin	Schmitt trigger TTL input buffer
5	CFG1	I	2.1 Ch/Stereo/Mono configuration pin	Schmitt trigger TTL input buffer
6	CLK_OUT	I/O	PLL ratio setting pin during power up, this pin is monitored on the rising edge of reset. PMF register will be default set at 1 or 4 times PLL ratio by setting this pin at High or Low. High: PMF [3:0] = [0000], 1 time of PLL ratio to avoid system MCLK over flow. Low: PMF [3:0] = [0100], 4 times of PLL ratio. This pin could be clock output pin also during normal operating if EN_CLK_OUT register bit is enabled.	TTL output buffer, internal pull Low with an 80Kohm resistor.
7	DGND	P	Digital Ground	
8	DVDD	P	Digital Power	

9	SDATA0	I	Serial audio data input 0	Schmitt trigger TTL input buffer
10	LRCIN	I	Left/Right clock input (Fs)	Schmitt trigger TTL input buffer
11	BCLK	I	Bit clock input (64Fs)	Schmitt trigger TTL input buffer
12	MCLK	I	Master clock input	Schmitt trigger TTL input buffer
13	N.C.			
14	VDDS1	P	Subwoofer1 channel supply	
15	S1A	O	Subwoofer1 channel output A	
16	GNDS1	P	Subwoofer1 channel ground	
17	S1B	O	Subwoofer1 channel output B	
18	VDDS1	P	Subwoofer1 channel supply	
19	VDDS2	P	Subwoofer2 channel supply	
20	S2B	O	Subwoofer2 channel output B	
21	GNDS2	P	Subwoofer2 channel ground	
22	S2A	O	Subwoofer2 channel output A

Functional Block Diagram

Ordering Information

Product ID	Package	Packing / MPQ	Comments
AD83586B-LG48NAY	E-LQFP-48L 7x7 mm	250 Units / Tray 2.5K Units / Box (10 Tray)	Green
AD83586B-LG48NAR	E-LQFP-48L 7x7 mm	2k Units / reel 1 reel / Box	Green

Available Package

Package Type	Device No.	$\theta_{ja} (^{\circ}\text{C}/\text{W})$	$\Psi_{jt} (^{\circ}\text{C}/\text{W})$	$\theta_{jt} (^{\circ}\text{C}/\text{W})$	Exposed Thermal Pad
7x7 48L E-LQFP	AD83586B	27.4	1.33	34.9	Yes (Note1)

Note 1.1: The thermal pad is located at the bottom of the package. To optimize thermal performance, soldering the thermal pad to the PCB's ground plane is suggested.

Note 1.2: θ_{ja} , the junction-to-ambient thermal resistance is simulated on a room temperature ($T_A=25^{\circ}\text{C}$), natural convection environment test board, which is constructed with a thermally efficient, 4-layers PCB (2S2P). The simulation is tested using the JESD51-5 thermal measurement standard.

Note 1.3: Ψ_{jt} represents the thermal parameter for the heat flow between the chip junction and the package's top surface center. It's extracted from the simulation data for obtaining θ_{ja} , using a procedure described in JESD51-2.

Note 1.4: θ_{jt} represents the thermal resistance for the heat flow between the chip junction and the package's top surface. It's extracted from the simulation data with obtaining a cold plate on the package top.

Absolute Maximum Ratings

Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device.

Symbol	Parameter	Min	Max	Units
DVDD	Supply for Digital Circuit	-0.3	3.6	V
PVDD	Supply for Driver Stage (VDDL/VDDR/VDDS1/VDDS2)	-0.3	30	V

C _I	Input Capacitance			6.4		pF

Note 2: Loudspeaker over-current protection is only effective when loudspeaker drivers are properly connected with external LC filters. Please refer to the application circuit example for recommended LC filter configuration.

Note 3: When concerning about short-circuit protection or performance, it is suggested using the choke with its I_{OC} larger than 10A.

Note 4: These capacitors should be placed as close to speaker jack as possible, and their values should be determined according to EMI test results.

Pin	Logic
PD	Power Down
DEF	Default Mute
PLL	Enable

Application Circuit Example for Stereo (Economic type, moderate EMI suppression)

Note 3: When concerning about short-circuit protection or performance, it is suggested using the choke with its I_{PC} larger than 10A.

Note 4: These capacitors should be placed as close to speaker jack as possible, and their values should be determined according to EMI test results.

Pin	Logic	0	1
PD	Power Down	Normal	Normal
DEF	Default Mute	Default Un-Mute	Default Un-Mute
PLL	Enable	External	External

Note 3: When concerning about short-circuit protection or performance, it is suggested using the choke with its I_{PC} larger than 20A.

Note 4: These capacitors should be placed as close to speaker jack as possible, and their values should be determined according to EMI test results.

Note 3: When concerning about short-circuit protection or performance, it is suggested using the choke with its I_{OC} larger than 10A.

Note 4: These capacitors should be placed as close to speaker jack as possible, and their values should be determined according to EMI test results.

Note 5: When concerning about short-circuit protection or performance, it is suggested using the choke with its I_{OC} larger than 5A.

Note 6: The snubber circuit can be removed while the $P_{VDD} \leq 18V$.

Pin	Logic	
PD	Power Down	Normal
DEF	Default Mute	Default Un-Mute
PLL	Enable	External

Electrical Characteristics and Specifications for Loudspeaker

● Stereo output (PBTTL)

Condition: $T_A=25^{\circ}\text{C}$, $\text{DVDD}=3.3\text{V}$, $\text{PVDD}=24\text{V}$, $F_S=48\text{kHz}$, Load= 4Ω with passive LC lowpass filter ($L=10\mu\text{H}$ with $R_{DC}=27\text{m}\Omega$, $C=470\text{nF}$); Input is 1kHz sinewave. Volume is 0dB unless otherwise specified.

Symbol	Parameter	Condition	Input Level	Min	Typ	Max	Units
P_O (Note 8)	RMS Output Power (THD+N=0.22%)				40		W
	RMS Output Power (THD+N=0.17%)				25		W
THD+N	Total Harmonic Distortion + Noise	$P_O=15\text{W}$			0.15		%
SNR	Signal to Noise Ratio(Note 7)		-1dB		98		dB
DR	Dynamic Range(Note 7)		-60dB		106		dB
V_n	Output Noise (Note 7)	20Hz to 20kHz			150		μV
PSRR	Power Supply Rejection Ratio	$V_{\text{RIPPLE}}=1V_{\text{RMS}}$ at 1kHz			-80		dB
	Channel Separation	$P_O=1\text{W}@1\text{kHz}$			-84		dB

Note 7: Measured with A-weighting filter.

Note 8: Thermal dissipation is limited by package type and PCB design. The external heat-sink or system cooling method should be adopted for maximum power output.

Noise margin at the HIGH level for each connected device (including hysteresis)	V_{nH}	$0.2V_{DD}$	---	$0.2V_{DD}$	---	V

Operation Description

● Operation modes

(i) Without I²C control

The default settings, Bass, Treble, EQ, Volume, DRC, PLL, Subwoofer Bandwidth, ..., and Sub-woofer gain are applied to register table content when using AD83586B without I²C control. The more information about default settings, please refer to the highlighted column of register table section.

(ii) With I²C control

When using I²C control, user can program suitable parameters into AD83586B for their specific applications. Please refer to the register table section to get the more detail.

● Internal PLL ($\overline{\text{PLL}}$)

AD83586B has a built-in PLL with multiple MCLK/FS ratio, which is selected by I²C control interface. If $\overline{\text{PLL}}$ pin is pulled low, the built-in PLL is enabled; if $\overline{\text{PLL}}$ pin is pulled high, an external clock source for MCLK less than 50MHz should be provided. The MCLK/FS ratio will be fixed at 1024x, 512x, or 256x with a sample frequency of 48kHz, 96kHz, or 192kHz respectively.

When using AD83586B without I²C control interface, the operation is as follows.

$\overline{\text{PLL}}$ pin is set to high:

Internal PLL is bypassed (Disable). The following master clock frequency is inputted into a MCLK pin by the sampling frequency. When the following master clock frequency cannot be inputted, $\overline{\text{PLL}}$ pin is set low. A career clock frequency is the frequency divided by 128 of master clock.

Fs	MCLK Frequency
48kHz	49.152MHz
44.1kHz	45.158MHz
32kHz	32.768MHz

$\overline{\text{PLL}}$ pin is set to low:

Internal PLL is enabled. The master clock inputted into the MCLK pin becomes the frequency of quad edge evaluation. A career clock frequency is the frequency divided by 32 of master clock.

● Reset

When the $\overline{\text{RESET}}$ pin is lowered, AD83586B will clear the stored data and reset the register table to default values. AD83586B will exit reset state at the 256th MCLK cycle after the $\overline{\text{RESET}}$ pin is raised to high.

● Power down control

AD83586B has a built-in volume fade-in/fade-out design for PD/Mute function. The relative PD timing diagrams for loudspeakers are shown below.

$$T_{fade} = \left| 10^{\frac{target(dB)}{20}} - 10^{\frac{original(dB)}{20}} \right| \times 128 \times (1/96kHz)$$

The volume level will be decreased to $-\infty$ dB in several LRCIN cycles. Once the fade-out procedure is finished, AD83586B will turn off the power stages, stop clock signals (MCLK, BCLK) from feeding into digital circuit and turn off the current of the internal analog circuits. After PD pin is pulled low, AD83586B needs up to 510 LRCIN clocks to finish the above works before entering power down state. Users can't program AD83586B during power down state, but all the settings of register table will still be kept except that DVDD is removed.

If the PD function is disabled in the midway of the fade-out procedure, AD83586B will also execute the fade-in procedure. In addition, AD83586B will establish the analog circuits' bias current and feed the clock signals (MCLK, BCLK) into digital circuits. Then, AD83586B will return to its normal operation without power down.

● Default volume (DEF)

The default volume of AD83586B is +1.675 dB while DEF pin setting at high, the default volume can be muted by selecting DEF pin low. When using AD83586B without I²C control interface, users should pull this pin high. The default value of register table setting will be changed for different applications. About the more detailed information, please refer to the register table section.

- Self-protection circuits

AD83586B has built-in protection circuits including thermal, short-circuit and under-voltage detection circuits.

- (i) When the internal junction temperature is higher than 150°C, power stages will be turned off and AD83586B will return to normal operation once the temperature drops to 120°C. The temperature values may vary around 10%.
- (ii) The short-circuit protection circuit protects the output stage when the wires connected to loudspeakers are shorted to each other or GND/VDD. For normal 24V operations, the current flowing through the power stage will be less than 6A for stereo configuration or less than 12A for mono configuration. Otherwise, the short-circuit detectors may pull the $\overline{\text{ERROR}}$ pin to DGND, disabling the output stages. When the over-temperature or short-circuit condition occurs, the open-drain $\overline{\text{ERROR}}$ pin will be pulled low and latched into ERROR state.

Once the over-temperature or short-circuit condition is removed, AD83586B will exit ERROR state when one of the following conditions is met: (1) $\overline{\text{RESET}}$ pin is pulled low, (2) $\overline{\text{PD}}$ pin is pulled low, (3) Master mute is enabled through the I²C interface.

- (iii) Once the DVDD voltage is lower than 2.7V, AD83586B will turn off its loudspeaker power stages and cease the operation of digital processing circuits. When DVDD becomes larger than 2.8V, AD83586B will return to normal operation.
- (iv) If the master clock inputted into MCLK pin stops during the period for 500 ns or more, AD83586B detect the stop of MLCK. In this state, amplifier outputs are forced to Weak Low. If master clock is inputted normally again, $\overline{\text{ERROR}}$ pin is set to low. AD83586B won't leave ERROR state until one of the following conditions: (1) $\overline{\text{Reset}}$ pin is pulled low, (2) $\overline{\text{PD}}$ pin is pulled low, (3) Programming master mute via I²C interface. $\overline{\text{PD}}$ pin is recommended set to low, when stop the clock inputted into MCLK, BCLK, and LRCIN during operation.

- MS

During system initialization, the content of this EEPROM can be loaded automatically into AD83586B registers and RAM when MS pin of AD83586B is set high. In other words, during initialization, for a short period of time (~76ms for MCLK=48kHzx256 and ~113ms for MCLK =32kHzx256 with PLL enable and PMF = 0100), AD83586B will behave like an IC master to fetch data from EEPROM content into registers and RAM automatically. After this is finished, AD83586B will become an I²C slave, waiting the master to send commands. When MS pin is set low, AD83586B will always behave like an I²C slave. Note that the size of the EEPROM shall be larger than 4Kb, such as Microchips' 24LC04B, because in total, there are 371 bytes of data. The first 256 bytes of data is stored from address 1010000, and the last 115 bytes of data is stored from address 101001.

- LINEIN

When set LINEIN pin low, AD83586B will select I²S data from SDATA0. On the contrary, AD83586B will select I²S data from SDATA1 when set LINEIN pin high. Before changing LINEIN pin status, users need to send I²C signal to mute AD83586B to avoid pop sound.

- Anti-pop design

AD83586B will generate appropriate control signals to suppress pop sounds during initial power on/off, power down/up, mute, and volume level changes.

- 3D surround sound

AD83586B provides the virtual surround sound technology with greater separation and depth voice quality for stereo signals.

● Power on sequence

Hereunder is AD83586B's power on sequence. Please note that we suggested users set DEF pin at low state initially, and than give a de-mute command via I²C when the whole system is stable.

● Output configuration

AD83586B can be configured to Stereo or Mono mode by the pin of CFG0. If 2.1channel configuration is required on your applications, you can select it from the pin of CFG1 to enable it.

CFG1	CFG0	Configuration Mode
0	0	Mono
0	1	Stereo
1	x	2.1 Channel

Configuration figures:

I²C-Bus Transfer Protocol

● Introduction

AD83586B employs I²C-bus transfer protocol. Two wires, serial data and serial clock carry information between the devices connected to the bus. Each device is recognized by a unique 7-bit address and can operate as either a transmitter or a receiver. The master device initiates a data transfer and provides the serial clock on the bus. AD83586B is always an I²C slave device.

● Protocol

■ START and STOP condition

START is identified by a high to low transition of the SDA signal. A START condition must precede any command for data transfer. A STOP is identified by a low to high transition of the SDA signal. A STOP condition terminates communication between AD83586B and the master device on the bus. In both START and STOP, the SCL is stable in the high state.

■ Data validity

The SDA signal must be stable during the high period of the clock. The high or low change of SDA only occurs when SCL signal is low. AD83586B samples the SDA signal at the rising edge of SCL signal.

■ Device addressing

The master generates 7-bit address to recognize slave devices. When AD83586B receives 7-bit address matched with 0110x0y (where x and y can be selected by external SA0 and SA1 pins, respectively), AD83586B will acknowledge at the 9th bit (the 8th bit is for R/W bit). The bytes following the device identification address are for AD83586B internal sub-addresses.

■ Data transferring

Each byte of SDA signaling must consist of 8 consecutive bits, and the byte is followed by an acknowledge bit. Data is transferred with MSB first, as shown in the figure below. In both write and read operations, AD83586B supports both single-byte and multi-byte transfers. Refer to the figure below for detailed data-transferring protocol.

Register Table

The AD83586B's audio signal processing data flow is shown below. Users can control these functions by programming appropriate settings in the register table. In this section, the register table is summarized first. The definition of each register follows in the next section.

Dual bands DRC disable,

Dual bands DRC enable,

Detail Description for Register

Note that the highlighted columns are default values of these tables. If there is no highlighted value, the default setting of this bit is determined by the external pin.

● Address 0X00 : State control 1

AD83586B supports multiple serial data input formats including I²S, Left-alignment and Right-alignment. These formats is selected by users via bit7~bit5 of address 0X00. The left/right channels can be exchanged to each other by programming to bit0 of address 0X00, LREXC.

BIT	NAME	DESCRIPTION	VALUE	FUNCTION

● Address 0X01 : State control 2

AD83586B has a built-in PLL which can be bypassed by pulling the PLL pin High. When PLL is bypassed, AD83586B only supports 1024x, 512x and 256x MCLK/Fs ratio for Fs is 32/44.1/48kHz, 64/88.2/96kHz, and 128/176.4/192kHz respectively. When PLL is enabled, multiple MCLK/Fs ratios are supported. Detail setting is shown in the following table.

BIT	NAME	DESCRIPTION	VALUE	FUNCTION
B[7]		Reserved

● Address 0X03 : Master volume control

AD83586B supports both master-volume (Address 0X03) and channel-volume control (Address 0X04, 0X05 and 0X06) modes. Both volume control settings range from +12dB ~ -103dB and 0.5dB per step. Note that the master volume control is added to the individual channel volume control as the total volume control. For example, if the master volume level is set at, Level A (in dB unit) and the channel volume level is set at Level B (in dB unit), the total volume control setting is equal to Level A plus with Level B.

-103dB ≤ Total volume (Level A + Level B) ≤ +24dB.

- Address 0X07/0X08 : Bass/Treble tone boost and cut

Last two sets of EQ can be programmed as bass/treble tone boost and cut. When, register with address 0X0A, bit-6, BTE is set to high, the EQ-7 and EQ-8 will perform as bass and treble respectively. The -3dB corner frequency of bass is 360Hz, and treble is 7kHz. The gain range for both filters is +12db ~ -12dB with 1dB per step.

			1111	---

● Address 0X0A : State control 4

The AD83586B provides this register to configure the audio processing enable or bypass and channel link. The DC blocking high pass and EQ can be enabled or bypass. During the link bit is set to logic high, the post-scale scaling factor or EQ for all of channel can be mapped to channel-1. This provides much simple audio sound processing setup. A noise gate detection mute feature is built-in for AD83586B. If a channel receives 2048 consecutive samples smaller than noise gate level, then this channel is muted when the function is enabled.

- Address 0X14~0X24 : User-defined coefficients registers

An on-chip RAM in AD83586B stores user-defined EQ and mixing coefficients. The content of this coefficient RAM is indirectly accessed via coefficient registers, which consist of one base address register (address 0X14), five sets of registers (address 0X15 to 0X23) of three consecutive 8-bit entries for each 24-bit coefficient, and one control register (address 0X24) to control access of the coefficients in the RAM..

- Address 0X2A : Power saving mode switching level

If the PWM exceeds the programmed switching power level (default 26*40ns), the modulation algorithm will change from quaternary into power saving mode. It results in higher power efficiency during larger power output operations. If the PWM drops below the programmed switching power level, the modulation algorithm will change back to quaternary modulation. If the PWM width is smaller than switching level minus switching window (default (26-5)*40ns), the modulation algorithm will leave from power saving mode into quaternary.

Total Harmonic Distortion + Noise vs. Output Power (Stereo)

Total Harmonic Distortion + Noise vs. Output Power (2.1CH)

- Address 0X2B : Volume fine tune

AD83586B supports both master-volume fine tune and channel-volume control fine tune modes. Both volume control settings range from 0dB ~ -0.375dB and 0.125dB per step. Note that the master volume fine tune is added to the individual channel volume fine tune as the total volume fine tune.

BIT	NAME	DESCRIPTION	VALUE	FUNCTION

			10	-0.25dB
			11	-0.375dB

- Address 0X2D : Device ID register

AD83586B has device ID which contains device number and version number.

BIT	NAME	DESCRIPTION	VALUE	FUNCTION
B[7:4]	DN	Device number	0010	Identification code
B[3:0]	VN	Version number	0000	Identification code

The procedure to read/write coefficient(s) from/to RAM is as followings:

Read a single coefficient from RAM:

1. Write 7-bits of address to I2C address 0X14
2. Write 1 to R1 bit in address 0X24
3. Read top 8-bits of coefficient in I2C address 0X15
4. Read middle 8-bits of coefficient in I2C address 0X16
5. Read bottom 8-bits of coefficient in I2C address 0X17

Read a set of coefficients from RAM:

1. Write 7-bits of address to I2C address 0X14
2. Write 1 to RA bit in address 0X24
3. Read top 8-bits of coefficient A1 in I2C address 0X15
4. Read middle 8-bits of coefficient A1 in I2C address 0X16
5. Read bottom 8-bits of coefficient A1 in I2C address 0X17
6. Read top 8-bits of coefficient A2 in I2C address 0X18
7. Read middle 8-bits of coefficient A2 in I2C address 0X19
8. Read bottom 8-bits of coefficient A2 in I2C address 0X1A
9. Read top 8-bits of coefficient B1 in I2C address 0X1B
10. Read middle 8-bits of coefficient B1 in I2C address 0X1C
11. Read bottom 8-bits of coefficient B1 in I2C address 0X1D
12. Read top 8-bits of coefficient B2 in I2C address 0X1E
13. Read middle 8-bits of coefficient B2 in I2C address 0X1F
14. Read bottom 8-bits of coefficient B2 in I2C address 0X20
15. Read top 8-bits of coefficient A0 in I2C address 0X21
16. Read middle 8-bits of coefficient A0 in I2C address 0X22
17. Read bottom 8-bits of coefficient A0 in I2C address 0X23

Write a single coefficient from RAM:

1. Write 7-bits of address to I2C address 0X14
2. Write top 8-bits of coefficient in I2C address 0X15
3. Write middle 8-bits of coefficient in I2C address 0X16
4. Write bottom 8-bits of coefficient in I2C address 0X17
5. Write 1 to W1 bit in address 0X24

Write a set of coefficients from RAM:

1. Write 7-bits of address to I2C address 0X14
2. Write top 8-bits of coefficient A1 in I2C address 0X15
3. Write middle 8-bits of coefficient A1 in I2C address 0X16
4. Write bottom 8-bits of coefficient A1 in I2C address 0X17
5. Write top 8-bits of coefficient A2 in I2C address 0X18
6. Write middle 8-bits of coefficient A2 in I2C address 0X19
7. Write bottom 8-bits of coefficient A2 in I2C address 0X1A
8. Write top 8-bits of coefficient B1 in I2C address 0X1B
9. Write middle 8-bits of coefficient B1 in I2C address 0X1C
10. Write bottom 8-bits of coefficient B1 in I2C address 0X1D
11. Write top 8-bits of coefficient B2 in I2C address 0X1E
12. Write middle 8-bits of coefficient B2 in I2C address 0X1F
13. Write bottom 8-bits of coefficient B2 in I2C address 0X20
14. Write top 8-bits of coefficient A0 in I2C address 0X21
15. Write middle 8-bits of coefficient A0 in I2C address 0X22
16. Write bottom 8-bits of coefficient A0 in I2C address 0X23
17. Write 1 to WA bit in address 0X24

Note that: the read and write operation on RAM coefficients works only if LRCIN (pin-15) switching on rising edge. And, before each writing operation, it is necessary to read the address 0X24 to confirm whether RAM is writable current in first. If the logic of W1 or WA is high, the coefficient writing is prohibited.

● User-defined equalizer

The AD83586B provides 20 parametric Equalizer (EQ). Users can program suitable coefficients via I²C control interface to program the required audio band frequency response for every EQ. The transfer function

$$H(z) = \frac{A_0 + A_1 z^{-1} + A_2 z^{-2}}{1 + B_1 z^{-1} + B_2 z^{-2}}$$

The data format of 2's complement binary code for EQ coefficient is 3.21. i.e., 3-bits for integer (MSB is the sign bit) and 21-bits for mantissa. Each coefficient range is from 0x800000 (-4) to 0x7FFFFFFF (+3.999999523). These coefficients are stored in User Defined RAM and are referenced in following manner:

$$\begin{aligned} CHxEQyA0 &= A0 \\ CHxEQyA1 &= A1 \\ CHxEQyA2 &= A2 \\ CHxEQyB1 &= -B1 \\ CHxEQyB2 &= -B2 \end{aligned}$$

Where x and y represents the number of channel and the band number of EQ equalizer.

All user-defined filters are path-through, where all coefficients are defaulted to 0 after being powered up, except the A0 that is set to 0x200000 which represents 1.

● Mixer

The AD83586B provides mixers to generate the extra audio source from the input left and right channels. The coefficients of mixers are defined in range from 0x800000 (-1) to 0x7FFFFFFF (0.9999998808). The function block diagram is as following:

● Pre-scale

For each audio channel, AD83586B can scale input signal level prior to EQ processing which is realized by a 24-bit signed fractional multiplier. The pre-scale factor, ranging from -1 (0x800000) to 0.9999998808 (0x7FFFFFFF), for this multiplier, can be loaded into RAM. The default values of the pre-scaling factors are set to 0x7FFFFFFF. Programming of RAM is described in RAM access.

● Post-scale

The AD83586B provides an additional multiplication after equalizing and before interpolation stage, which is realized by a 24-bit signed fractional multiplier. The post-scaling factor, ranging from -1 (0x800000) to 0.9999998808 (0x7FFFFFFF), for this multiplier, can be loaded into RAM. The default values of the post-scaling factors are set to 0x7FFFFFFF. All channels can use the channel-1 post-scale factor by setting the post-scale link. Programming of RAM is described in RAM access.

● Power Clipping

The AD83586B provides power clipping function to avoid excessive signal that may destroy loud speaker. Two sets of power clipping are provided. One is used for both channel 1 and channel 2, while the other is used for channel 3. The power clipping level is defined by 24-bit representation and is stored in RAM address 0X6F and 0X70. The following table shows the power clipping level's numerical representation.

Sample calculation for power clipping

Max amplitude	dB	Linear	Decimal	Hex (3.21 format)
PVDD	0	1	2097152	200000
PVDD*0.707	-3	0.707	1482686	169FEB
PVDD*0.5	-6	0.5	1048576	100000
PVDD*L	x	$L=10^{(x/20)}$	$D=2097152 \times L$	$H=\text{dec2hex}(D)$

● Attack threshold

The AD83586B provides power limited function. When the input exceeds the programmable attack threshold value, the output power will be limited by this threshold power level via gradual gain reduction. Two sets of power limit are provided. One is used of channel 1 and channel 2, while the other is used for channel3. Attack threshold is defined by 24-bit representation and is stored in RAM address 0X71 and 0X72.

- Release threshold

After AD83586B has reached the attack threshold, its output power will be limited to that level. The output power level will be gradually adjusted to the programmable release threshold level. Two sets of power limit are provided. One is used of channel 1 and channel 2, while the other is used for channel3. Release threshold is defined by 24-bit representation and is stored in RAM address 0X73 and 0X74. The following table shows the attack and release threshold's numerical representation.

Sample calculation for attack and release threshold

Power	dB	Linear	Decimal	Hex (3.21 format)
$(PVDD^2)/R$	0	1	2097152	200000
$(PVDD^2)/2R$	-3	0.5	1048576	100000
$(PVDD^2)/4R$	-6	0.25	524288	80000
$((PVDD^2)/R)*L$	x	$L=10^{(x/10)}$	$D=2097152 \times L$	$H=dec2hex(D)$

To best illustrate the power limit function, please refer to the following figure.

● Noise Gate Attack Level

When both left and right signals have 2048 consecutive sample points less than the programmable noise gate attack level, the audio signal will multiply noise gate gain, which can be set at x1/8, x1/4, x1/2, or zero if the noise gate function is enabled. Noise gate attack level is defined by 24-bit representation and is stored in RAM address 0X75.

● Noise Gate Release Level

After entering the noise gating status, the noise gain will be removed whenever AD83586B receives any input signal that is more than the noise gate release level. Noise gate release level is defined by 24-bit representation and is stored in RAM address 0X76. The following table shows the noise gate attack and release threshold level’s numerical representation.

Sample calculation for noise gate attack and release level

Input amplitude (dB)	Linear	Decimal	Hex (1.23 format)
0	1	8388607	7FFFFFF
-100	10^{-5}	83	53
-110	$10^{-5.5}$	26	1A
x	$L=10^{(x/20)}$	$D=8388607 \times L$	$H=\text{dec2hex}(D)$

● DRC Energy Coefficient

The above figure illustrates the digital processing of calculating RMS signal power. In this processing, a DRC energy coefficient is required, which can be programmed for different frequency range. Two sets of energy coefficients are provided. One is used of channel 1 and channel 2, while the other is used for channel3. Energy coefficient is defined by 24-bit representation and is stored in RAM address 0X77 and 0X78. The following table shows the DRC energy coefficient numerical representation.

Sample calculation for DRC energy coefficient

DRC energy coefficient	dB	Linear	Decimal	Hex (1.23 format)
1	0	1	8388607	7FFFFFF
1/256	-48.2	1/256	32768	8000
1/1024	-60.2	1/1024	8192	2000
L	x	$L=10^{(x/20)}$	$D=2097152 \times L$	$H=\text{dec2hex}(D)$

- The user defined RAM

The contents of user defined RAM is represented in following table.

0x73	CH3 DRC Attack threshold	DRC2_ATH	0x200000
0x74	CH3 DRC Release threshold	DRC2_RTH	0x80000
0x75	Noise Gate Attack Level	NGAL	0x00001A
0x76	Noise Gate Release Level	NGRL	0x000053
0x77	DRC1 Energy Coefficient	DRC1_EC	0x8000
0x78	DRC2 Energy Coefficient	DRC2_EC	0x2000
0x79	A0 of SRS HPF	SRSH_A0	C7B691
0x7A	A1 of SRS HPF	SRSH_A1	38496E
0x7B	B1 of SRS HPF	SRSH_B1	C46f8
0x7C	A0 of SRS LPF	SRSL_A0	E81B9
0x7D	A1 of SRS LPF	SRSL_A1	F22C12
0x7E	B1 of SRS LPF	SRSL_B1	FCABB

Package Dimensions

● E-LQFP 48L (7x7mm)

Symbol	Dimension in mm	
	Min	Max
A	--	1.60
A1	0.05	0.15
b	0.17	0.27
c	0.09	0.20
D	6.90	7.10
D1	8.90	9.10
E	6.90	7.10
E1	8.90	9.10
e	0.50 BSC	
L	0.45	0.75

Exposed pad

	Dimension in mm	
	Min	Max
D2	4.31	5.21
E2	4.31	5.21

Revision History

Revision	Date	Description
0.1	2014.12.17	Original.
0.2	2015.02.03	1) Modify Output Power for 2.0, 2.1 and mono. 2) Modify the Description of DRC Detection.
1.0	2015.03.04	Remove preliminary word and modify version to 1.0
1.1	2015.09.25	New add "tape reel "packing information
1.2	2016.06.29	Modify order information
1.3	2016.09.01	Modify order information
1.4	2020.05.04	Update Application Circuit Example for Stereo, Mono and 2.1CH.

No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of ESMT or others.

Any semiconductor devices may have inherently a certain rate of failure. To minimize risks associated with customer's application, adequate design and operating safeguards against injury, damage, or loss from such failure, should be provided by the customer when making application designs.

ESMT's products are not authorized for use in critical applications such as, but not limited to, life support devices or system, where failure or abnormal operation may directly affect human lives or cause physical injury or property damage. If products described here are to be used for such kinds of application, purchaser must do its own quality assurance testing appropriate to such applications.
