

Power Consumption

1. Customer Specification:

5V/2A

2. Test equipment:

1. Eagle EVT board V005.
2. AC POWER: APG-1005N: 220Vac @60Hz
3. AC Adapter: BSY012U050200U 5V/2A
4. 4K HDR TV: Sony KD-55X9000E
5. Power meter with accumulator: Yokogawa WT210

3. Test Items and Condition:

0. Add external loading to USB with 5V/900mA. Video play is as item 1, the results is shown as below "5. Test Results".
1. Video play back with 4K stream through Smart YouTube, WiFi disable, Play Video format: 3840X2160, 60fps, 29.25Mbit, id:337, video/vp9.2, HDR on.
2. Normal condition without video play, WiFi disable, UI display only
3. Standby mode
4. Deep sleep mode

4. Test Environment:

1. Test place: FXN CNSBG Building 1F office
2. Test DUT name: 1. Eagle EVT V005 board, 2. EVB board
3. Test environment condition : temperature: 25 deg-C, humidity: 65
4. Test date: 2019/2/19
5. Test process:
 1. DUT power on
 2. Display 4k stream, HDR on (As Test condition, item 1 video format)
 3. Aging 30 minutes, then measure the consumption with power meter.
(real time measurement after aging 30 minutes)
6. Test result: See 5th test results.
7. Test setup picture (block diagram and real test environment picture)

Note: 4K HDR 4Kp60 video is only 5 minutes, so the power meter to measurement of Eagle board only accumulate 5 minutes.

An example of the calculation for real power value: measure result is 219.14mWH, so the real power of Eagle board is $219.14\text{mWH} / (5/60) = 2629.68\text{mW} = 2.63\text{W}$

5. Test Results: Kernal version: 4.9.113 #34 Tue Feb 19 14:56:38 CST 2019

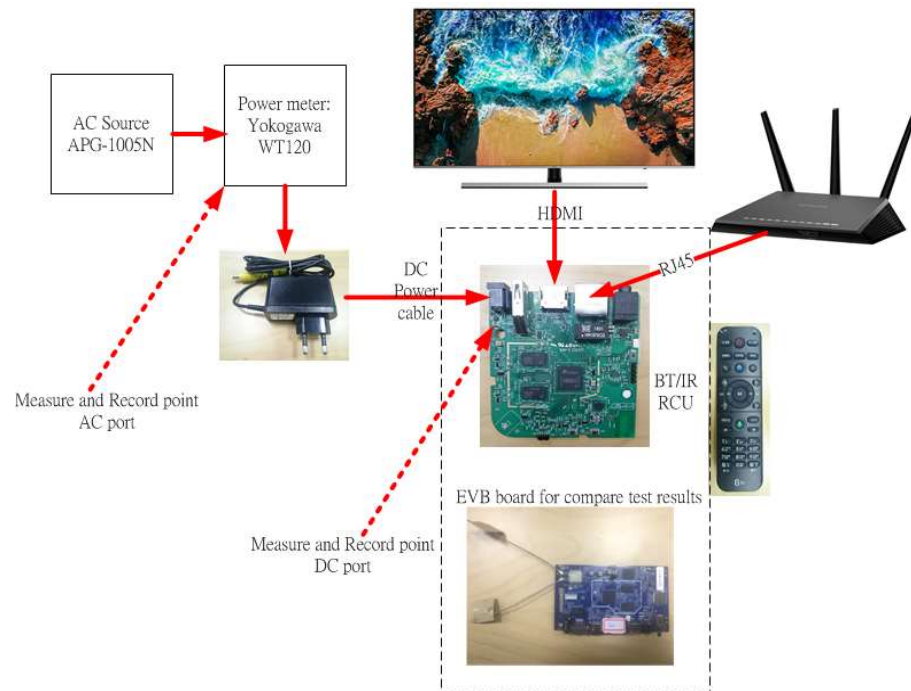

Item No. (please refer section 3 for the detailed test condition)	AC port AML EVB board	AC port Eagle Board	DC port Eagle Board		
0	220Vac/95mA @60Hz, 9.7894W	220Vac/80mA @60Hz, 8.2962W	4.95Vdc/1.28A, 6.435W		
1	220Vac/48mA @60Hz, 3.8W	220Vac/32mA @60Hz, 2.63W	5.04Vdc/400mA, 2.016W		
2	220Vac/29mA @60Hz, 2.2W	220Vac/20mA @60Hz, 1.51W	5.10Vdc/200mA, 1.02W		
3	220Vac/19mA @60Hz, 1.3W	220Vac/20mA @60Hz, 1.35W	5.11Vdc/190mA, 0.9709W		
4	220Vac/7.7mA @60Hz, 0.44W	NA	NA		

Note: 1. Item 4 is deep sleep mode, Eagle board is not included this mode since Sleep mode in Eagle board is not implemented yet.

2. EVB board: Standby mode(1.3W)-->Deep sleep mode(0.44W)(needs 1~2 minutes).

3. The EVB board power consumption in standby mode that the result higher than previous result could be caused by instrument difference
